

The cloud has an address.

And it might be in your city.

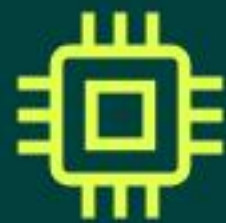

So, what is a *data centre*?

A building full of computers called **servers**. They store, process and send the data behind almost everything you do online, 24 hours a day.

Store

Photos, chats,
bank records

Process

Payments,
searches, AI
answers

Deliver

Videos and
pages to your
phone

*Think of it as a warehouse, but instead of goods,
it holds the internet.*

Everything you do online *lives in one.*

UPI payments

Reels & shorts

Cricket & OTT

Cloud photos

AI chatbots

Maps & cabs

24₊bn

UPI transactions in a single month: **September 2026**. That is over **800 million a day**.

Source: NPCI monthly UPI statistics, September 2026 (24.07 bn transactions).

Data centres never sleep. *Neither does their power demand.*

Servers run 24×7, and so does the cooling that keeps them safe. All of it runs on electricity.

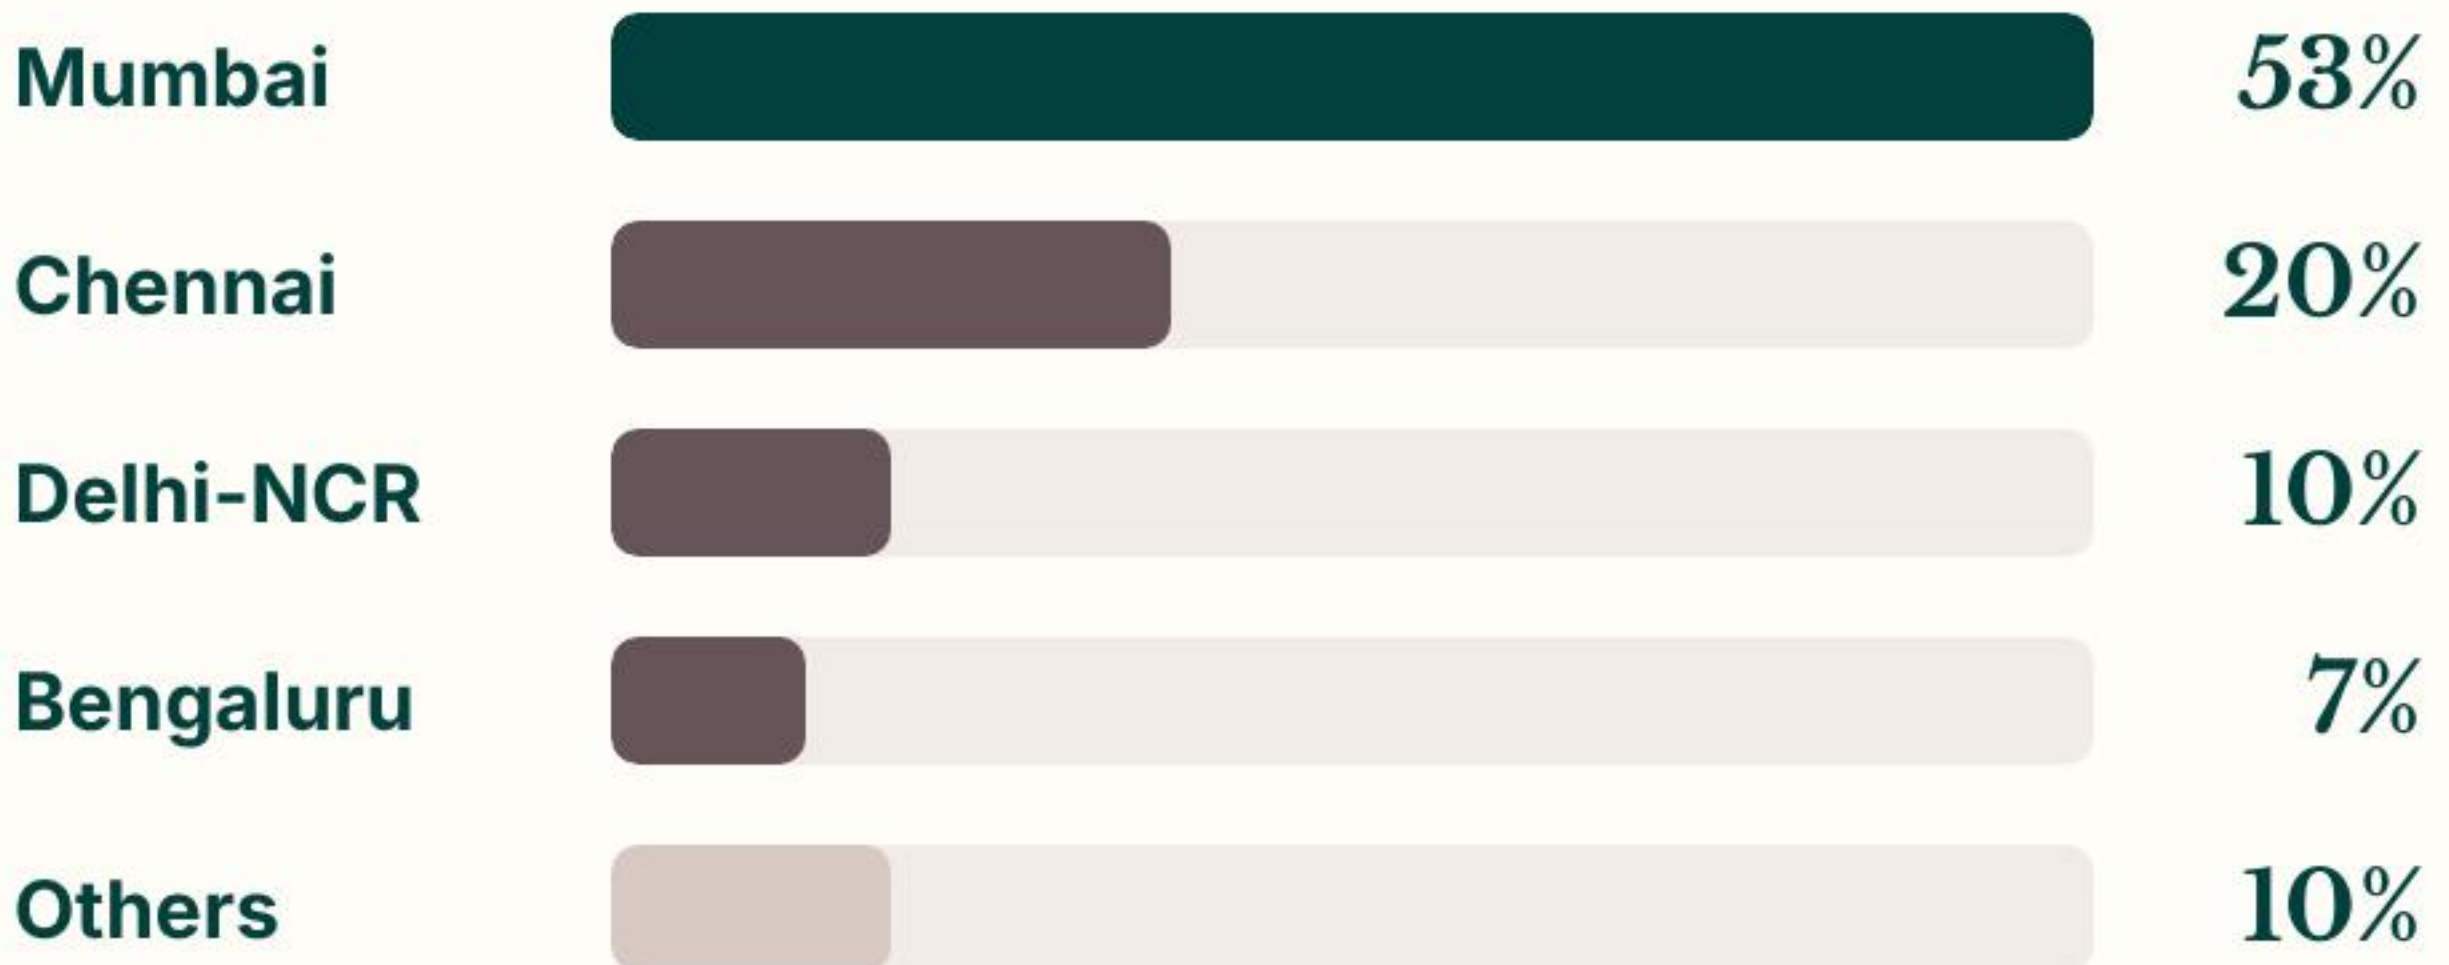

In 2024, data centres used about **1.5% of the world's electricity**, and demand is set to **more than double** by 2030.

Source: IEA, *Energy and AI* (2025): global data centre electricity use, base case.

India runs on about *1.5 GW* of data centres.

And they're concentrated in a few cities. Mumbai alone hosts roughly half.

Share of India's operational data centre capacity, September 2025

Sources: MeitY (≈ 1.5 GW national capacity, 2025); CBRE (city shares, Sept 2025). Other reports estimate Mumbai's share at 40–53% depending on measure.

And India is building *fast.*

Rules to store Indians' data in India

Capacity could roughly **triple** by 2030.

Sources: MeitY (2025 capacity); Colliers (2025) projection for India's top seven data centre markets.

— THE HOPEFUL PART

India's power grid is *getting cleaner.*

India has installed **300 GW+** of non-fossil power capacity, more than **60%** of its 2030 target.

That's now **over 54%** of all installed capacity.

Honest note: capacity isn't the same as generation. Coal still supplies most of India's electricity today. The cleaner the grid gets, the cleaner every data centre on it becomes.

Source: MNRE, non-fossil installed capacity as of 31 July 2026 (300.5 GW).

If data centres grow
with clean power,
*India's digital boom
can be a green one.*
